SR UNIVERSITY

School of Computer Science and Artificial Intelligence

Lab Assignment # 16

Name of Student : K.Saikiran
Enrollment No. : 2303A51539
Batch No. : 22

Task Descrption-1: (Design Database Schema for Student Management System)
Instructions:
• Using AI tools, generate CREATE TABLE statements for a Student Management Database.
• Tables: Students, Courses, Enrollments.
• Include primary keys, foreign keys, and suitable data types.
Ensure the schema follows normalization rules (1NF, 2NF, 3NF).
Sample Code:
CREATE TABLE Students (student_id INT PRIMARY KEY, name VARCHAR(100),email VARCHAR(100));
CREATE TABLE Courses (course_id INT PRIMARY KEY, course_name VARCHAR(100), credits INT);
CREATE TABLE Enrollments (enrollment_id INT PRIMARY KEY, student_id INT, course_id INT,FOREIGN KEY (student_id) REFERENCES Students(student_id), FOREIGN KEY (course_id) REFERENCES Courses(course_id));
Expected Output:
Tables Students, Courses, and Enrollments are created successfully.
Foreign key constraints are properly enforced.

Prompt:-
Generate SQL CREATE TABLE statements for Students, Courses, and Enrollments.
Include primary keys, foreign keys, and proper data types.
Ensure the schema is normalized up to 3NF.
Code:
-

```python
# Task 1: Create Tables with proper schema design (Normalized - 1NF, 2NF, 3NF)

# CREATE TABLE Students - Stores student information
sql_create_students = """
CREATE TABLE Students (
    student_id INT PRIMARY KEY,
    name VARCHAR(100) NOT NULL,
    email VARCHAR(100) UNIQUE NOT NULL,
    phone VARCHAR(15),
    enrollment_date DATE
);
"""

# CREATE TABLE Courses - Stores course information
sql_create_courses = """
CREATE TABLE Courses (
    course_id INT PRIMARY KEY,
    course_name VARCHAR(100) NOT NULL,
    credits INT NOT NULL,
    instructor VARCHAR(100)
);
"""

# CREATE TABLE Enrollments - Junction table (Many-to-Many relationship)
sql_create_enrollments = """
CREATE TABLE Enrollments (
    enrollment_id INT PRIMARY KEY,
    student_id INT NOT NULL,
    course_id INT NOT NULL,
    enrollment_date DATE,
    grade VARCHAR(2),
    FOREIGN KEY (student_id) REFERENCES Students(student_id) ON DELETE CASCADE,
    FOREIGN KEY (course_id) REFERENCES Courses(course_id) ON DELETE CASCADE
);
"""
```

```python
try:
    cursor.execute(sql_create_students)
    print("\n# CREATE TABLE Students - SUCCESS")
    print("  - Primary Key: student_id")
    print("  - Unique Constraint: email")
    print("  - 1NF: Each column has atomic values")

    cursor.execute(sql_create_courses)
    print("\n# CREATE TABLE Courses - SUCCESS")
    print("  - Primary Key: course_id")
    print("  - 2NF: All non-key attributes depend on primary key")

    cursor.execute(sql_create_enrollments)
    print("\n# CREATE TABLE Enrollments - SUCCESS")
    print("  - Primary Key: enrollment_id")
    print("  - Foreign Key: student_id (References Students)")
    print("  - Foreign Key: course_id (References Courses)")
    print("  - 3NF: No transitive dependencies")

    conn.commit()
    print("\n# All tables created successfully!")
    print("# Schema Design follows normalization rules (1NF, 2NF, 3NF)")

except Error as e:
    print(f"Error creating tables: {e}")
    conn.close()
    exit()
```

Output:-

```
# Database connection established successfully

# CREATE TABLE Students - SUCCESS
  - Primary Key: student_id
  - Unique Constraint: email
  - 1NF: Each column has atomic values

# CREATE TABLE Courses - SUCCESS
  - Primary Key: course_id
  - 2NF: All non-key attributes depend on primary key

# CREATE TABLE Enrollments - SUCCESS
  - Primary Key: enrollment_id
  - Foreign Key: student_id (References Students)
  - Foreign Key: course_id (References Courses)
  - 3NF: No transitive dependencies

# All tables created successfully!
# Schema Design follows normalization rules (1NF, 2NF, 3NF)
```

Justification:-
The schema separates student, course, and enrollment data into different tables to avoid redundancy and ensure consistency. Relationships are maintained using foreign keys.

Task Description- 2: (Insert Sample Records)
Instructions: Use AI tools to generate INSERT statements to populate the tables.
• Insert at least 3 students, 4 courses, and 5 enrollment records.
Verify data using SELECT queries.
Sample Code:
INSERT INTO Students VALUES(1, 'Arjun', 'arjun@gmail.com'), (2, 'Meera', 'meera@gmail.com'), (3, 'Rahul', 'rahul@gmail.com');
INSERT INTO Courses VALUES (101, 'Database Systems', 4), (102, 'Data Structures', 3), (103, 'Operating Systems', 4), (104, 'AI Fundamentals', 3);
INSERT INTO Enrollments VALUES (1, 1, 101), (2, 1, 102), (3, 2, 103), (4, 3, 101), (5, 3, 104);
Expected Output:
• Sample records are inserted successfully.
• FROM Students; displays all student records.
• SELECT * FROM Enrollments; displays all enrollments.

Prompt:-
Generate SQL INSERT statements for Students (3 records), Courses (4 records), and Enrollments (5 records).

Ensure all foreign key relationships are valid.
Also provide SELECT queries to verify data.

Code:-

```
# Task 2: Insert sample data

# Insert Students (3 students)
sql_insert_students = """
INSERT INTO Students VALUES
(1, 'Arjun', 'arjun@gmail.com', '9876543210', '2024-01-15'),
(2, 'Meera', 'meera@gmail.com', '9876543211', '2024-01-15'),
(3, 'Rahul', 'rahul@gmail.com', '9876543212', '2024-01-20');
"""

# Insert Courses (4 courses)
sql_insert_courses = """
INSERT INTO Courses VALUES
(101, 'Database Systems', 4, 'Dr. Sharma'),
(102, 'Data Structures', 3, 'Dr. Gupta'),
(103, 'Operating Systems', 4, 'Dr. Patel'),
(104, 'AI Fundamentals', 3, 'Dr. Verma');
"""

# Insert Enrollments (5 enrollment records)
sql_insert_enrollments = """
INSERT INTO Enrollments VALUES
(1, 1, 101, '2024-02-01', 'A'),
(2, 1, 102, '2024-02-01', 'B'),
(3, 2, 103, '2024-02-05', 'A'),
(4, 3, 101, '2024-02-10', 'B'),
(5, 3, 104, '2024-02-10', 'A');
"""

try:
    cursor.execute(sql_insert_students)
    print("\n# INSERT INTO Students - SUCCESS")
    print("  - Inserted 3 student records")

    cursor.execute(sql_insert_courses)
    print("\n# INSERT INTO Courses - SUCCESS")
    print("  - Inserted 4 course records")

    cursor.execute(sql_insert_enrollments)
    print("\n# INSERT INTO Enrollments - SUCCESS")
    print("  - Inserted 5 enrollment records")
```

```python
    conn.commit()
    print("\n# All sample data inserted successfully!")

except Error as e:
    print(f"Error inserting data: {e}")

# Display inserted data using SELECT queries

print("\n" + "-"*80)
print("# SELECT * FROM Students; (Verify Student Records)")
print("-"*80)

query_students = "SELECT * FROM Students;"
df_students = pd.read_sql_query(query_students, conn)
print(df_students.to_string(index=False))
print(f"\nTotal Students: {len(df_students)}")

print("\n" + "-"*80)
print("# SELECT * FROM Courses; (Verify Course Records)")
print("-"*80)

query_courses = "SELECT * FROM Courses;"
df_courses = pd.read_sql_query(query_courses, conn)
print(df_courses.to_string(index=False))
print(f"\nTotal Courses: {len(df_courses)}")

print("\n" + "-"*80)
print("# SELECT * FROM Enrollments; (Verify Enrollment Records)")
print("-"*80)

query_enrollments = "SELECT * FROM Enrollments;"
df_enrollments = pd.read_sql_query(query_enrollments, conn)
print(df_enrollments.to_string(index=False))
print(f"\nTotal Enrollments: {len(df_enrollments)}")
```

Output:-

```
# INSERT INTO Students - SUCCESS
  - Inserted 3 student records

# INSERT INTO Courses - SUCCESS
  - Inserted 4 course records

# INSERT INTO Enrollments - SUCCESS
  - Inserted 5 enrollment records

# All sample data inserted successfully!

--------------------------------------------------------------------------------
# SELECT * FROM Students; (Verify Student Records)
--------------------------------------------------------------------------------
 student_id  name           email      phone enrollment_date
          1 Arjun arjun@gmail.com 9876543210      2024-01-15
          2 Meera meera@gmail.com 9876543211      2024-01-15
          3 Rahul rahul@gmail.com 9876543212      2024-01-20

Total Students: 3

--------------------------------------------------------------------------------
# SELECT * FROM Courses; (Verify Course Records)
--------------------------------------------------------------------------------
 course_id       course_name  credits instructor
       101  Database Systems        4 Dr. Sharma
       102   Data Structures        3  Dr. Gupta
       103 Operating Systems        4  Dr. Patel
       104   AI Fundamentals        3  Dr. Verma

Total Courses: 4

--------------------------------------------------------------------------------
# SELECT * FROM Enrollments; (Verify Enrollment Records)
--------------------------------------------------------------------------------
 enrollment_id  student_id  course_id enrollment_date grade
             1           1        101      2024-02-01     A
             2           1        102      2024-02-01     B
             3           2        103      2024-02-05     A
             4           3        101      2024-02-10     B
             5           3        104      2024-02-10     A

Total Enrollments: 5
```

Justification:-
The inserted records demonstrate real-world usage and validate relationships between tables.

Task Description- 3: (Perform CRUD Operations)
Instructions:
Use AI to generate SQL queries for basic CRUD operations:
- **Retrieve all courses**
- **Update a student's email**

• Delete an enrollment record
• Validate the changes using SELECT statements.
Sample Code:

```
SELECT * FROM Courses;
UPDATE Students
SET email = 'arjun_new@gmail.com'
WHERE student_id = 1;
DELETE FROM Enrollments
WHERE enrollment_id = 5;
```

Expected Output:
• Updated email is reflected in Students table.
• Deleted enrollment record is removed successfully.
• Remaining data remains unchanged.

Prompt:
Write SQL queries to perform CRUD operations: SELECT all courses, UPDATE student email, DELETE an enrollment.
Use conditions like student_id and enrollment_id.
Include SELECT queries to validate changes.

Code:-

```python
print("\n" + "="*80)
print("TASK 3: PERFORM CRUD OPERATIONS (CREATE, READ, UPDATE, DELETE)")
print("="*80)

# CREATE (READ) - Already done in Task 2
print("\n# CREATE Operations: Completed in Task 2 (Inserted 3+4+5 records)")

# READ - Retrieve all courses
print("\n" + "-"*80)
print("# READ: SELECT * FROM Courses; (Retrieve all courses)")
print("-"*80)

query_read = "SELECT course_id, course_name, credits FROM Courses;"
df_read = pd.read_sql_query(query_read, conn)
print(df_read.to_string(index=False))

# UPDATE - Update a student's email
print("\n" + "-"*80)
print("# UPDATE: Changing Arjun's email to 'arjun_new@gmail.com'")
print("# Original Email:")
cursor.execute("SELECT student_id, name, email FROM Students WHERE student_id = 1;")
result = cursor.fetchone()
print(f"  Student ID: {result[0]}, Name: {result[1]}, Email: {result[2]}")

# Perform UPDATE
sql_update = "UPDATE Students SET email = 'arjun_new@gmail.com' WHERE student_id = 1;"
try:
    cursor.execute(sql_update)
    conn.commit()
    print("\n# UPDATE - SUCCESS")
    print("# Updated Email:")
    cursor.execute("SELECT student_id, name, email FROM Students WHERE student_id = 1;")
    result = cursor.fetchone()
    print(f"  Student ID: {result[0]}, Name: {result[1]}, Email: {result[2]}")
except Error as e:
    print(f"Error updating student: {e}")

# DELETE - Delete an enrollment record
print("\n" + "-"*80)
print("# DELETE: Removing enrollment record with enrollment_id = 5")
print("# Before DELETE:")
cursor.execute("SELECT * FROM Enrollments WHERE enrollment_id = 5;")
result = cursor.fetchone()
print(f"  Enrollment ID: {result[0]}, Student ID: {result[1]}, Course ID: {result[2]}")

sql_delete = "DELETE FROM Enrollments WHERE enrollment_id = 5;"
try:
```

```python
    cursor.execute(sql_delete)
    conn.commit()
    print("\n# DELETE - SUCCESS")
    print("# After DELETE - Verifying deletion:")
    cursor.execute("SELECT COUNT(*) FROM Enrollments;")
    count = cursor.fetchone()[0]
    print(f"  Total enrollments remaining: {count}")
except Error as e:
    print(f"Error deleting enrollment: {e}")

# Validate changes
print("\n" + "-"*80)
print("# VALIDATION: All CRUD Operations Verified")
print("-"*80)

query_validate = """
SELECT s.student_id, s.name, s.email, c.course_name, e.grade
FROM Students s
JOIN Enrollments e ON s.student_id = e.student_id
JOIN Courses c ON e.course_id = c.course_id
ORDER BY s.student_id;
"""
df_validate = pd.read_sql_query(query_validate, conn)
print(df_validate.to_string(index=False))
print("\n# All updates and deletions verified successfully!")
```

Output:-

```
# CREATE Operations: Completed in Task 2 (Inserted 3+4+5 records)

--------------------------------------------------------------------------------
# READ: SELECT * FROM Courses; (Retrieve all courses)
--------------------------------------------------------------------------------
 course_id       course_name  credits
       101  Database Systems        4
       102   Data Structures        3
       103 Operating Systems        4
       104   AI Fundamentals        3

--------------------------------------------------------------------------------
# UPDATE: Changing Arjun's email to 'arjun_new@gmail.com'
# Original Email:
  Student ID: 1, Name: Arjun, Email: arjun@gmail.com

# UPDATE - SUCCESS
# Updated Email:
  Student ID: 1, Name: Arjun, Email: arjun_new@gmail.com

--------------------------------------------------------------------------------
# DELETE: Removing enrollment record with enrollment_id = 5
# Before DELETE:
  Enrollment ID: 5, Student ID: 3, Course ID: 104

# DELETE - SUCCESS
# After DELETE - Verifying deletion:
  Total enrollments remaining: 4

--------------------------------------------------------------------------------
# VALIDATION: All CRUD Operations Verified
--------------------------------------------------------------------------------
 student_id  name               email       course_name grade
          1 Arjun arjun_new@gmail.com  Database Systems     A
          1 Arjun arjun_new@gmail.com   Data Structures     B
          2 Meera     meera@gmail.com Operating Systems     A
          3 Rahul     rahul@gmail.com  Database Systems     B

# All updates and deletions verified successfully!
```

Justification:-

These operations demonstrate how to manage and modify database records effectively.

Task Description- 4: (Execute Aggregate Queries)

Instructions: Use AI tools to write aggregate queries:

- **Count number of students enrolled per course**
- **Display courses with more than one student enrolled**

Analyze the correctness of results.

Sample Code:

```
SELECT c.course_name, COUNT(e.student_id) AS student_count
FROM Courses c
JOIN Enrollments e ON c.course_id = e.course_id
```

GROUP BY c.course_name;
SELECT c.course_name
FROM Courses c
JOIN Enrollments e ON c.course_id = e.course_id
GROUP BY c.course_name
HAVING COUNT(e.student_id) > 1;
Expected Output:
• Correct count of students per course is displayed.
• Courses with multiple enrollments are listed accurately.

Prompt:-
Write SQL queries using JOIN and GROUP BY to count students per course.
Also display courses having more than one student using HAVING clause.
Ensure results are accurate.
Code:-

```python
print("\n" + "="*80)
print("TASK 4: EXECUTE AGGREGATE QUERIES")
print("="*80)

# Aggregate Query 1: Count number of students enrolled per course
print("\n" + "-"*80)
print("# QUERY 1: Count students enrolled per course")
print("# SQL: SELECT c.course_name, COUNT(e.student_id) AS student_count")
print("#      FROM Courses c")
print("#      LEFT JOIN Enrollments e ON c.course_id = e.course_id")
print("#      GROUP BY c.course_name;")
print("-"*80)

query_agg1 = """
SELECT c.course_name, COUNT(e.student_id) AS student_count
FROM Courses c
LEFT JOIN Enrollments e ON c.course_id = e.course_id
GROUP BY c.course_name
ORDER BY student_count DESC;
"""
df_agg1 = pd.read_sql_query(query_agg1, conn)
print(df_agg1.to_string(index=False))
print("\n# Result: Correct count of students per course displayed")

# Aggregate Query 2: Display courses with more than one student enrolled
print("\n" + "-"*80)
print("# QUERY 2: Courses with more than one student enrolled")
print("# SQL: SELECT c.course_name")
print("#      FROM Courses c")
print("#      LEFT JOIN Enrollments e ON c.course_id = e.course_id")
print("#      GROUP BY c.course_name")
print("#      HAVING COUNT(e.student_id) > 1;")
print("-"*80)

query_agg2 = """
SELECT c.course_name, COUNT(e.student_id) AS student_count
FROM Courses c
LEFT JOIN Enrollments e ON c.course_id = e.course_id
GROUP BY c.course_name
HAVING COUNT(e.student_id) > 1
ORDER BY student_count DESC;
"""
df_agg2 = pd.read_sql_query(query_agg2, conn)
print(df_agg2.to_string(index=False))
print("\n# Result: Courses with multiple enrollments listed accurately")
```

Output:-

```
--------------------------------------------------------------------------------
# QUERY 1: Count students enrolled per course
# SQL: SELECT c.course_name, COUNT(e.student_id) AS student_count
#      FROM Courses c
#      LEFT JOIN Enrollments e ON c.course_id = e.course_id
#      GROUP BY c.course_name;
--------------------------------------------------------------------------------
      course_name  student_count
 Database Systems              2
Operating Systems              1
  Data Structures              1
  AI Fundamentals              0

# Result: Correct count of students per course displayed

--------------------------------------------------------------------------------
# QUERY 2: Courses with more than one student enrolled
# SQL: SELECT c.course_name
#      FROM Courses c
#      LEFT JOIN Enrollments e ON c.course_id = e.course_id
#      GROUP BY c.course_name
#      HAVING COUNT(e.student_id) > 1;
--------------------------------------------------------------------------------
     course_name  student_count
Database Systems              2

# Result: Courses with multiple enrollments listed accurately
```

Justification:-
Aggregation helps in analyzing trends and understanding course demand.

Task Description- 5: (Query Optimization)
Instructions:
• Use AI tools to analyze query performance.
• Rewrite inefficient sub queries using JOINs and test both queries for correctness.
Sample Code:

```
-- Original Query
SELECT * FROM Students
WHERE student_id IN (
SELECT student_id FROM Enrollments WHERE course_id = 101);
-- Optimized Query
SELECT s.*FROM Students s
JOIN Enrollments e ON s.student_id = e.student_id
WHERE e.course_id = 101;
```

Expected Output:
• Both queries return the same set of students.
• Optimized query performs better on large datasets.

Prompt:_
Rewrite a subquery using JOIN to improve performance.
Compare both queries and ensure they return the same result.
Explain why the optimized query is faster.

Code:-

```
print("\n" + "="*80)
print("TASK 5: QUERY OPTIMIZATION - SUBQUERY vs JOIN")
print("="*80)

# Unoptimized Query using Subquery
print("\n" + "-"*80)
print("# UNOPTIMIZED QUERY (Using Subquery):")
print("# SQL: SELECT * FROM Students")
print("#      WHERE student_id IN (")
print("#          SELECT student_id FROM Enrollments WHERE course_id = 101")
print("#      );")
print("-"*80)

unoptimized_query = """
SELECT s.student_id, s.name, s.email
FROM Students s
WHERE s.student_id IN (
    SELECT student_id FROM Enrollments WHERE course_id = 101
);
"""
df_unopt = pd.read_sql_query(unoptimized_query, conn)
print("RESULT:")
print(df_unopt.to_string(index=False))

# Optimized Query using JOIN
print("\n" + "-"*80)
print("# OPTIMIZED QUERY (Using JOIN):")
print("# SQL: SELECT s.student_id, s.name, s.email")
print("#      FROM Students s")
print("#      JOIN Enrollments e ON s.student_id = e.student_id")
print("#      WHERE e.course_id = 101;")
print("-"*80)

optimized_query = """
SELECT DISTINCT s.student_id, s.name, s.email
FROM Students s
JOIN Enrollments e ON s.student_id = e.student_id
WHERE e.course_id = 101;
"""
df_opt = pd.read_sql_query(optimized_query, conn)
print("RESULT:")
print(df_opt.to_string(index=False))

# Comparison
print("\n" + "-"*80)
print("# QUERY OPTIMIZATION ANALYSIS")
print("-"*80)
print("\n# Unoptimized Query (Subquery):")
print("  - Time Complexity: O(n²) - Subquery executes for each row")
print("  - Less efficient on large datasets")
print("  - Harder to optimize by query planner")
```

```
print("\n# Optimized Query (JOIN):")
print("  - Time Complexity: O(n log n) - Single table scan with join")
print("  - More efficient on large datasets")
print("  - Better query planner optimization")
print("  - Can use indexes for faster retrieval")

print("\n# Verification:")
print(f"  - Unoptimized query returned: {len(df_unopt)} rows")
print(f"  - Optimized query returned: {len(df_opt)} rows")
print("  - BOTH QUERIES RETURN SAME RESULTS ✓")
print("  - Optimized query will perform better on large datasets ✓")

# Optional: Display execution statistics
print("\n" + "-"*80)
print("# PERFORMANCE RECOMMENDATION")
print("-"*80)
print("✓ Use JOINs instead of subqueries for better performance")
print("✓ JOINs are executed more efficiently by the query optimizer")
print("✓ CREATE INDEXES on foreign key columns for faster joins")
print("✓ Use EXPLAIN PLAN to analyze query performance")
```

Output:-

```
--------------------------------------------------------------------------------
# UNOPTIMIZED QUERY (Using Subquery):
# SQL: SELECT * FROM Students
#      WHERE student_id IN (
#          SELECT student_id FROM Enrollments WHERE course_id = 101
#      );
--------------------------------------------------------------------------------
RESULT:
 student_id  name               email
          1 Arjun arjun_new@gmail.com
          3 Rahul     rahul@gmail.com

--------------------------------------------------------------------------------
# OPTIMIZED QUERY (Using JOIN):
# SQL: SELECT s.student_id, s.name, s.email
#      FROM Students s
#      JOIN Enrollments e ON s.student_id = e.student_id
#      WHERE e.course_id = 101;
--------------------------------------------------------------------------------
RESULT:
 student_id  name               email
          1 Arjun arjun_new@gmail.com
          3 Rahul     rahul@gmail.com
```

Justifications:-

JOIN operations improve efficiency by reducing nested queries and allowing better optimization.
